TO WHOMSOEVER IT MAY CONCERN

We have installed BacComber system in two cooling towers 250 TR each catering to Process Chiller of 220 TR capacity on December 17, 2004. The water in the cooling towers started becoming clear within a few days after installation.

We descaled two of our chillers at the same time. On February 20, 2005 we opened both these chillers. The water in one of these was treated in the cooling tower with chemicals and the other with BacComber. The photographs taken before cleaning of the two condensers are attached. The one treated with BacComber had no scales and is clean. The other one had hard scales and slime.

In the system where BacComber is installed we did not bleed the water from the date of installation till March 5, 2005 when the tank was cleaned during shut down. There are no algae in the cooling tower water.

We are very happy with the performance of BacComber and appreciate the service rendered by Ecospec India during the entire period.
